# Linux debugging, profiling, tracing and performance analysis training

On-line seminar, 4 sessions of 4 hours

Latest update: May 08, 2024

Title	**Linux debugging, profiling, tracing and performance analysis training**
Training objectives	• Be able to understand the main concepts of Linux that are relevant for performance analysis: process, threads, memory management, virtual memory, execution contexts, etc. • Be able to analyze why a system is loaded and what are the elements that contributes to this load using common Linux observability tools. • Be able to debug an userspace application using *gdb*, either live or after a crash, and analyze the contents of ELF binaries. • Be able to trace and profile a complete userspace application and its interactions with the Linux kernel in order to fix bugs using *strace*, *ltrace*, *perf* or *Callgrind*. • Be able to understand classical memory issues and analyze them using *valgrind*, *libefence* or *Massif*. • Be able to trace and profile the entire Linux system, using *perf*, *ftrace*, *kprobes*, *eBPF* tools, *kernelshark* or *LTTng* • Be able to debug Linux kernel issues: debug kernel crashes live or post-mortem, analyze memory issues at the kernel level, analyze locking issues, use kernel-level debuggers.
Duration	**Four** half days - 16 hours (4 hours per half day)
Pedagogics	• Lectures delivered by the trainer, over video-conference. Participants can ask questions at any time. • Practical demonstrations done by the trainer, based on practical labs, over video-conference. Participants can ask questions at any time. Optionally, participants who have access to the hardware accessories can reproduce the practical labs by themselves. • Instant messaging for questions between sessions (replies under 24h, outside of week-ends and bank holidays). • Electronic copies of presentations, lab instructions and data files. They are freely available at https://bootlin.com/doc/training/debugging.
Trainer	One of the engineers listed on: https://bootlin.com/training/trainers/

Language	Oral lectures: English, French. Materials: English.
Audience	Companies and engineers interested in debugging, profiling and tracing Linux systems and applications, to analyze and address performance or latency problems.
Prerequisites	• **Knowledge and practice of UNIX or GNU/Linux commands**: participants must be familiar with the Linux command line. Participants lacking experience on this topic should get trained by themselves, for example with our freely available on-line slides at bootlin.com/blog/command-line/. • **Minimal experience in embedded Linux development**: participants should have a minimal understanding of the architecture of embedded Linux systems: role of the Linux kernel vs. user-space, development of Linux user-space applications in C. Following Bootlin's *Embedded Linux* course at bootlin.com/training/embedded-linux/ allows to fulfill this pre-requisite. • **Minimal English language level: B1**, according to the *Common European Framework of References for Languages,* for our sessions in English. See bootlin.com/pub/training/cefr-grid.pdf for self-evaluation.
Required equipment	• Computer with the operating system of your choice, with the Google Chrome or Chromium browser for videoconferencing. • Webcam and microphone (preferably from an audio headset) • High speed access to the Internet
Certificate	Only the participants who have attended all training sessions, and who have scored over 50% of correct answers at the final evaluation will receive a training certificate from Bootlin.
Disabilities	Participants with disabilities who have special needs are invited to contact us at *training@bootlin.com* to discuss adaptations to the training course.

Real hardware in practical demos

The hardware platform used for the practical demos of this training session is the **STMicroelectronics STM32MP157D-DK1 Discovery board** board, which features:

- STM32MP157D (dual Cortex-A7) CPU from STMicroelectronics
- USB powered
- 512 MB DDR3L RAM
- Gigabit Ethernet port
- 4 USB 2.0 host ports
- 1 USB-C OTG port
- 1 Micro SD slot
- On-board ST-LINK/V2-1 debugger
- Arduino Uno v3-compatible headers
- Audio codec
- Misc: buttons, LEDs

Half day 1

Lecture - Linux application stack

- Global picture: understanding the general architecture of a Linux system, overview of the major components.
- What is the difference between a process and a thread, how applications run concurrently.
- ELF files and associated analysis tools.
- Userspace application memory layout (heap, stack, shared libraries mappings, etc).
- MMU and memory management: physical/virtual address spaces.
- Kernel context switching and scheduling
- Kernel execution contexts: kernel threads, workqueues, interrupt, threaded interrupts, softirq
Lecture - Common analysis & observability tools

- Analyzing an ELF file with GNU binary utilities (*objdump*, *addr2line*).
- Tools to monitor a Linux system: processes, memory usage and mapping, resources.
- Using *vmstat, iostat, ps, top, iotop, free* and understanding the metrics they provide.
- Pseudo filesystems: *procfs, sysfs* and *debugfs*.

Demo - Check what is running on a system and its load

- Observe running processes using *ps* and *top*.
- Check memory allocation and mapping with *procfs* and *pmap*.
- Monitor other resources usage using *iostat, vmstat* and *netstat*.

Lecture - Debugging an application

- Using *gdb* on a live process.
- Understanding compiler optimizations impact on debuggability.
- Postmortem diagnostic using core files.
- Remote debugging with *gdbserver*.
- Extending *gdb* capabilities using python scripting

Half day 2

Demo - Solving an application crash

- Analysis of compiled C code with compiler-explorer to understand optimizations.
- Managing *gdb* from the command line.
- Debugging a crashed application using a coredump with *gdb*.
- Using *gdb* Python scripting capabilities.

Lecture - Tracing an application

- Tracing system calls with *strace*.
- Tracing library calls with *ltrace*.
- Overloading library functions using *LD_-PRELOAD*.

Demo – Debugging application issues

- Analyze dynamic library calls from an application using *ltrace*.
- Overloading library functions using *LD_-PRELOAD*.
- Analyzing an application system calls using *strace*.

Lecture - Memory issues

- Usual memory issues: buffer overflow, segmentation fault, memory leaks, heap-stack collision.
- Memory corruption tooling, *valgrind*, *libefence*, etc.
- Heap profiling using *Massif* and *heaptrack*

Demo – Debugging memory issues

- Memory leak and misbehavior detection with *valgrind* and *vgdb*.
- Visualizing application heap using *Massif*.

Half day 3

Lecture – Application profiling

- Performances issues.
- Gathering profiling data with *perf*.
- Analyzing an application callgraph using *Callgrind* and *KCachegrind*.
- Interpreting the data recorded by *perf*.

Demo - Application profiling

- Profiling an application with *Callgrind*/*KCachegrind*.
- Analyzing application performance with *perf*.
- Generating a flamegraph using *FlameGraph*.

Lecture - System wide profiling and tracing

- System wide profiling using *perf*.
- Using *kprobes* to hook on kernel code without recompiling.
- *eBPF* tools (*bcctools, bpftrace*, etc) for complex tracing scenarios.
- Application and kernel tracing and visualization using *ftrace, kernelshark* or *LTTng*

Half day 4

Demo - System wide profiling and tracing

- System profiling with *perf*.
- IRQ latencies using *ftrace*.
- Tracing and visualizing system activity using *kernelshark* or *LTTng*

Lecture - Kernel debugging

- Kernel compilation results (`vmlinux`, `System.map`).
- Understanding and configuring kernel *oops* behavior.
- Post mortem analysis using kernel crash dump with *crash*.
- Memory issues (*KASAN, UBSAN, Kmemleak*).
- Debugging the kernel using *KGDB* and *KDB*.
- Kernel locking debug configuration options (lockdep).
- Other kernel configuration options that are useful for debug.

Demo - Kernel debugging

- Analyzing an *oops* after using a faulty module with *obdjump* and *addr2line*.
- Debugging a deadlock problem using *PROVE_LOCKING* options.
- Detecting undefined behavior with *UBSAN* in kernel code.
- Find a module memory leak using *kmemleak*.
- Debugging a module with *KGDB*.
